UID: 25MCI10266

Sub. N: Frontend Technology

Sub. Co 25CAH-655

Section: 25 MAM 1A

Front End Technology

Q1 What is Figma? Explain its features and why its widely used in modern UI/UX design.

- Ans
- ① Figma is ~~used~~ a cloud-based UI/UX design tool used to design websites, mobile apps and software interfaces.
 - ② It works directly in a web browser, so we have no heavy installation is required and it runs on any operating system.
 - ③ Figma supports real-time collaboration, allowing multiple designers and developers to work on the same file at a same time.
 - ④ It provides vector based design tools, which helps in creating scalable user interface elements.
 - ⑤ Figma introduces interactive prototyping, enabling designers to create clickable designs and user flow without coding.
 - ⑥ The component and design featur ensures consistency by reusing UI elements across projects.
 - ⑦ It offers developer's handoff features, generating design specs and code snippets for easy implementation.
 - ⑧ Widely used to save time, improve teamwork and simplify UI/UX.

Q2 Differentiate between Designing and prototyping in Figma?

Ans

Designing

- ① It refers to creating a visual layout of an interface such as colors, font, icons, buttons and overall screen structure.
- ② The main focus is totally upon how the UI looks, not the working.
- ③ Designers uses frames, shapes, texts and components to build screens.
- ④ It helps define branding, consistency and visual hierarchy.

Prototyping

- ① Prototyping refer to adding interactions and navigation between designed screens.
- ② Focused upon how UI performs and looks both sides.
- ③ It uses link buttons, add transitions and simulate user actions like clicks and swipes.
- ④ It helps user experience and usability before development.

⑤ Design answer the questions:-
"What will the app or website look?"

Eg:-

You create a login screen with text fields for email and password, a login button, colors and typography

⑤ Prototyping answers the questions:-
"How the user move throughout app?"

Eg:-

You link the login button to the Home screen so that when clicked, it stimulates logging in to the next page.

Q3 What are components and styles in Figma? How do they help in creating, maintaining consistency and saving time in large project

Ans Components in Figma

- ① They are reusable UI elements such as buttons, input fields, navbar and cards that can be used multiple times throughout a design.
- ① A main component act as a master, and any changes made to it will automatically update to all instances, ensuring uniformity.
- ① Components helps maintain design consistency by using the same UI elements throughout large projects.
- ① They significantly save time because designer's don't need to design the same element again and again.

Styles in Figma

- ① It defines reusable design properties such as colors, text styles (font, sizes) and effects (shadows, blurs).
- ① When a style is updated, all elements using that style update automatically across the entire project.
- ① Style ensures branding consistency, especially in large team working on the same design system.
- ① Together, components and styles make large projects faster to manage, easier to scale and less error-prone.

Q4 Explain auto-Layout in Figma. How does it help in creating responsive designs to different screen sizes?

Ans 2 Auto-layout in Figma :-

- ① Auto-layout is a figma feature that automatically arranges and resizes UI elements based on content, spacing and alignment rules.
- ② It allows designer to define padding, spacing between items, direction (horizontal/vertical) and alignment within a frame.
- ③ When text length or element size changes, auto-layout adjusts the layouts automatically without manual resizing.
- ④ It helps creating responsive designs by allowing components to stretch, shrink or wrap according to screen size.
- ⑤ Designer can set elements to hug content, fill container or have fixed sizes, which is essential for adaptability.
- ⑥ Auto-layout makes it easier to design for multiple screen sizes (mobile, tablet, desktop) using the same components.
- ⑦ It also speeds up iteration and ensures consistent spacing and structure across UI.

How it helps in responsive designs

- ① Buttons expands when text changes.
- ② Cards and list adjust automatically when screen width increases or decreases.
- ③ The small component can be reused across devices without destroying it.

Q5 Describe the complete developer handoff process in Figma. How are designers shared, assets exported and code snippets generated for developers?

Ans 2

Developer Handoff in Figma :-

- It is the process of transferring designs from designer to developer.
- It ensures developer understands layout, styles, assets and interactions.
- Figma provides built-in tools to avoid manual documentation.

Design Sharing :-

- Designer shares files using view or inspect access.
- Developer can see screens, components and prototypes.
- Real-time updates ensure everyone sees the latest design.

Asset Exporting :-

- Icons, images and illustrations can be exported directly.
- Assets are downloadable in formats like PNG, SVG and JPG.
- Export settings (size, scale) are predefined by designer.

Code Snippet Generation :-

- Figma automatically generates code snippets.
- Supports CSS, iOS (Swift) and Android (XML).
- Developer can copy exact values for colors, fonts and spacing.

Advantages :-

- Reduces communication gap.
- Saves development time.
- Minimizes design-to-code error.
